

PRODUCT NAME: SRM NT Event MIB for Windows NT Version 5.0 SPD 63.97.00

DESCRIPTION

System Resource Management (SRM) Version 5.0 consists of a set of products providing integrated Systems and Network Management Services in a Financial Business System (FBS) and large business accounts like Insurance and Healthcare industries.

The overall SRM configuration includes a centralized management system which controls branches connected to a Wide Area Network (WAN) based on TCP/IP and SNA communication protocols. In the branches the server and the workstations are interconnected via the LAN.

SRM Version 5.0 products supports Windows NT server and Windows/DOS workstations and ensures effective manageability of complex networked systems. The SRM products are installed in the distributed LAN based branch environment and interworks in a flexible way with various industry standard central management systems such as:

- POLYCENTER Manager on NetView (PNV) positioned as the central platform for FBS device management and network management.
- Microsoft's Systems Management Server (SMS) and AssetWORKS to receive configuration information from SRM branch products regarding installed FBS devices.
- IBM NetView program running in the IBM host which receives customer controlled events from FBS devices and PC applications. The IBM NetView operator can also execute remote Windows NT and SRM commands in the branch environment.

The SRM Version 5.0 products are:

SRM NT Event MIB for Windows NT

SRM Device MIB-I for Windows NT

SRM Event Logging for Windows NT

SRM NT Event MIB for Windows NT product features:

This product adds a SNMP agent to the Windows NT branch server, which enables a user of a SNMP management system to receive events from Windows NT Event log. The events are automatically forwarded to the central SNMP management system e.g. POLYCENTER NetView via the trap mechanism. In addition, the product includes MIB description file and MIB applications for data presentation in POLYCENTER NetView.

Within the monitored Windows NT system there are three event logs, the system log, the security log and the application log. Windows NT uses these logs to store information about events that have occurred in the Windows NT environment.

Institutions with large corporate networks require that the volume of the management traffic introduced in the network can be properly controlled.

SRM provides per event both filter mechanisms and thresholds to select events to report, how often to report and the report intervals. This mechanism protects effectively the network from bursts of events being sent to the central SNMP manager and makes it possible to send only the important events.

The product SRM Event Logging for Windows NT, above, reports to the application log on the NT server from the Windows/DOS workstation and includes information on FBS devices and from user programs.

SOFTWARE REQUIREMENTS

For Windows NT branch Server:

- Microsoft Windows NT operating system version 3.5 or later
- TCP/IP and SNMP (version 1) protocols must be installed and configured.

DISTRIBUTION MEDIA

DSHD 3.5-inch diskettes.

GROWTH CONSIDERATIONS

The minimum hardware/software requirements for any future version of this product may be different from the requirements for the current version.

ORDERING INFORMATION

Product Name/Version = SRM NT EVENT MIB Version 1.0
